

CLTP 7 Report

Summary and Final results

Mr. Jose Antonio Tolentino Veliz

UNI-FIM

CTIC – Smart Machines Laboratory

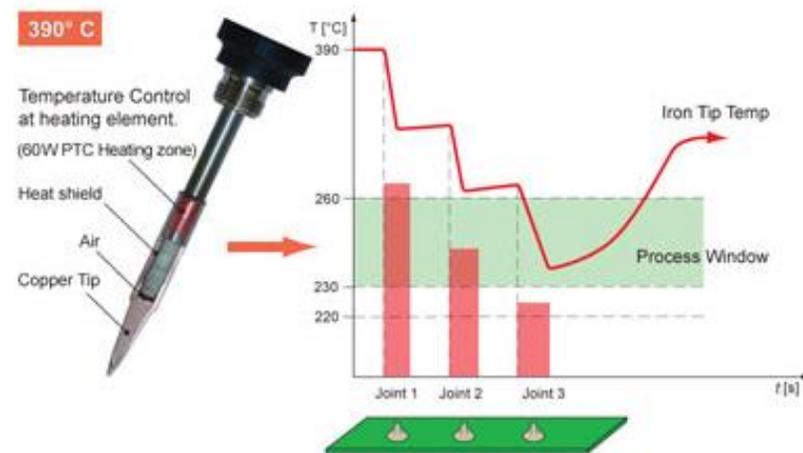

PERU

CLTP 7

Content

1. Soldering and assembly of the i-cansat kit.
2. Designing the cansat structure
3. Parachute an desinging and deployment test
4. Vibration and thermal tests
5. Programming-software
6. Rocket assembly and launch
7. Telemetry Results
8. Acknowledgments

1. Soldering and assembly of the i-cansat kit.

Every solder joint is colder than the one before.

2. i-Cansat Structure designing.

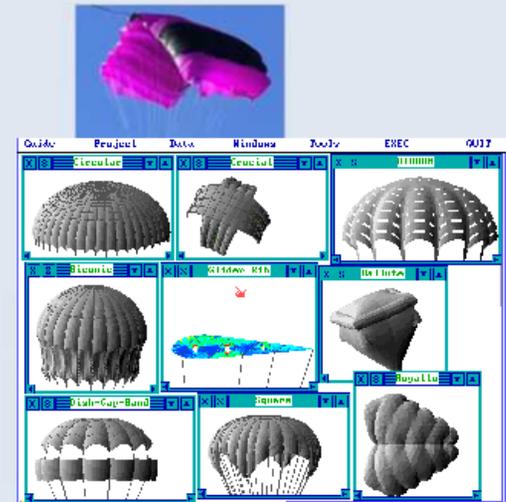

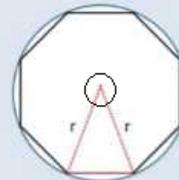

3. Parachute and deployment test and desiging

DRAG COEFFICIENT

- Area of the parachute
- Shape of the parachute
 - hemispherical
 - cross
 - hexagonal
 - plane
- Lowering speed

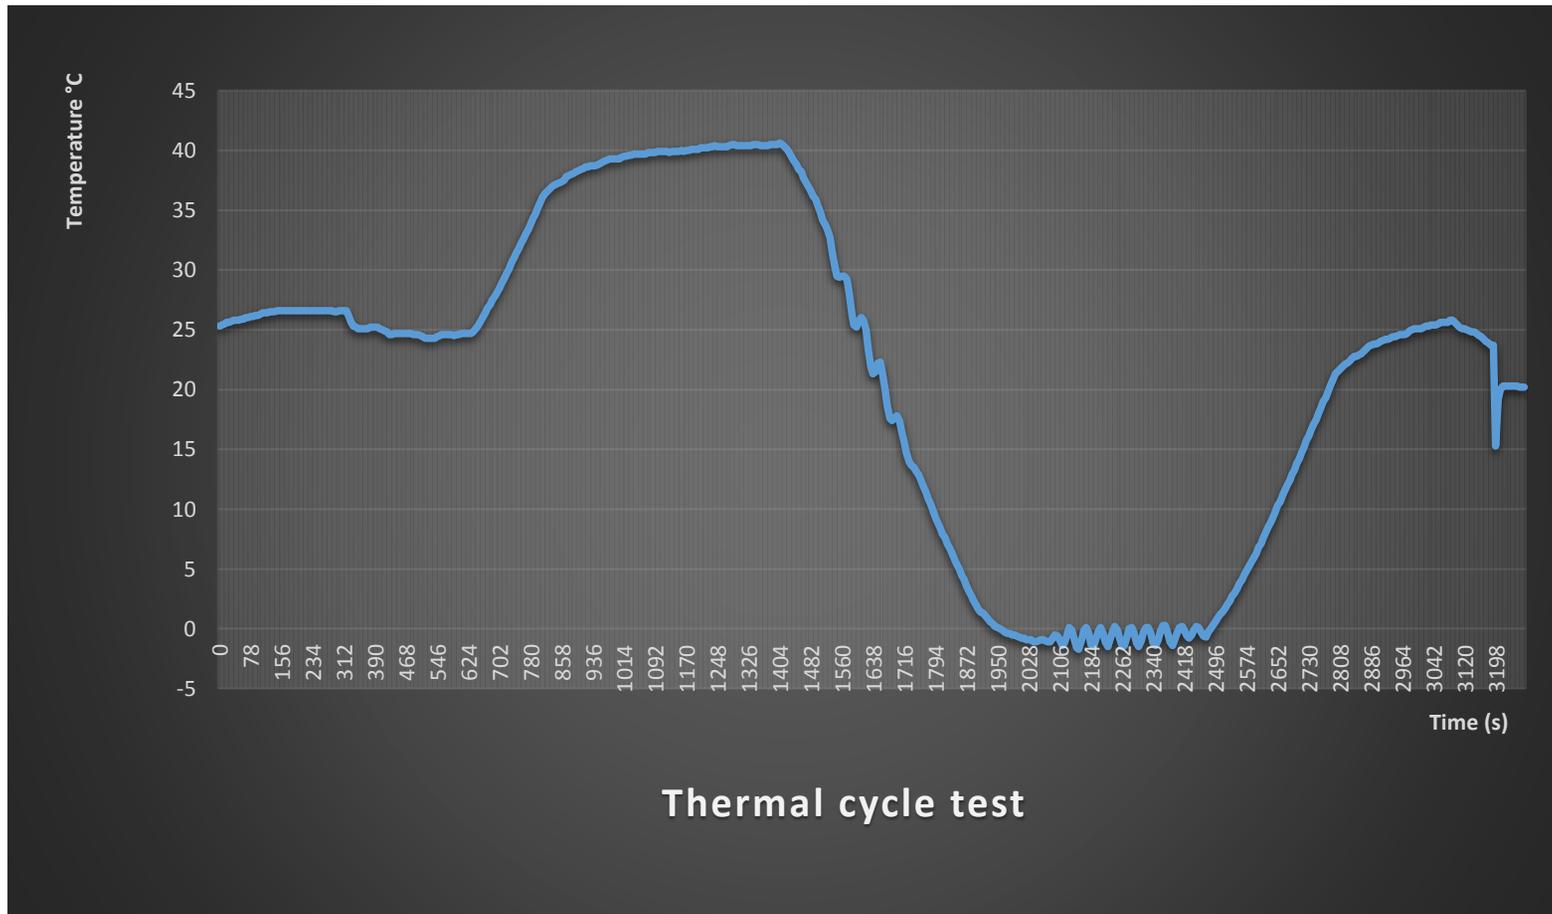

4. Vibration and thermal test

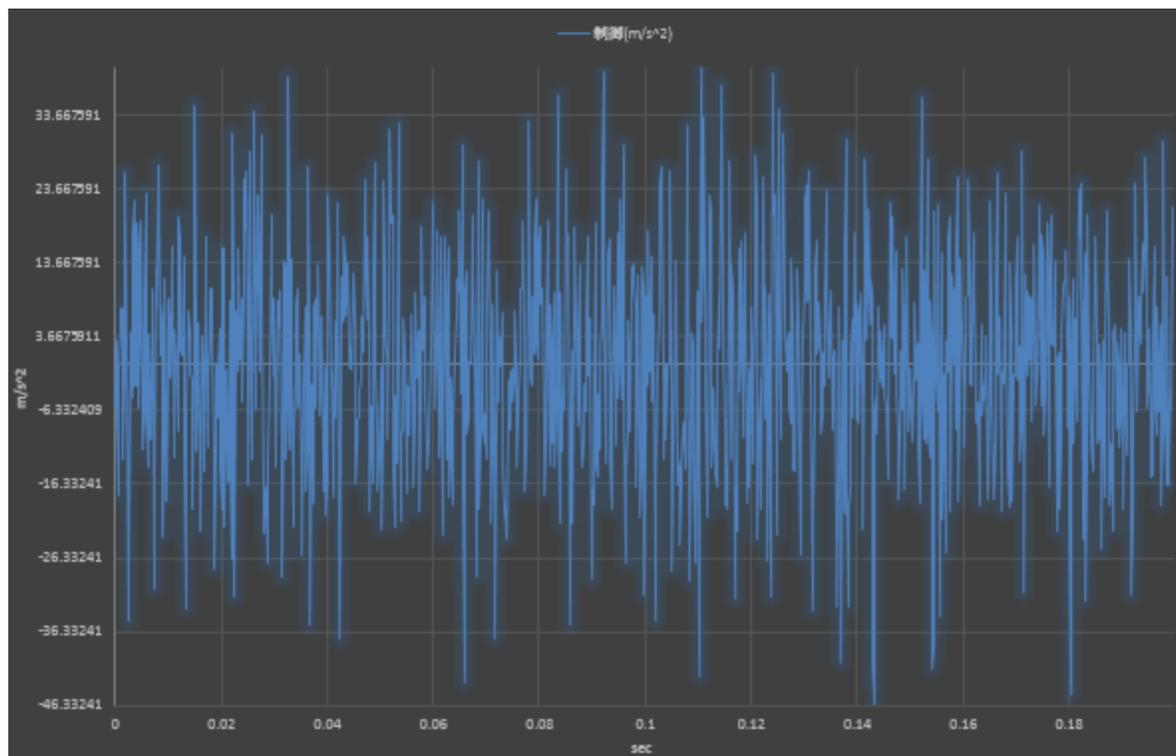

Thermal Test

Vibration Test

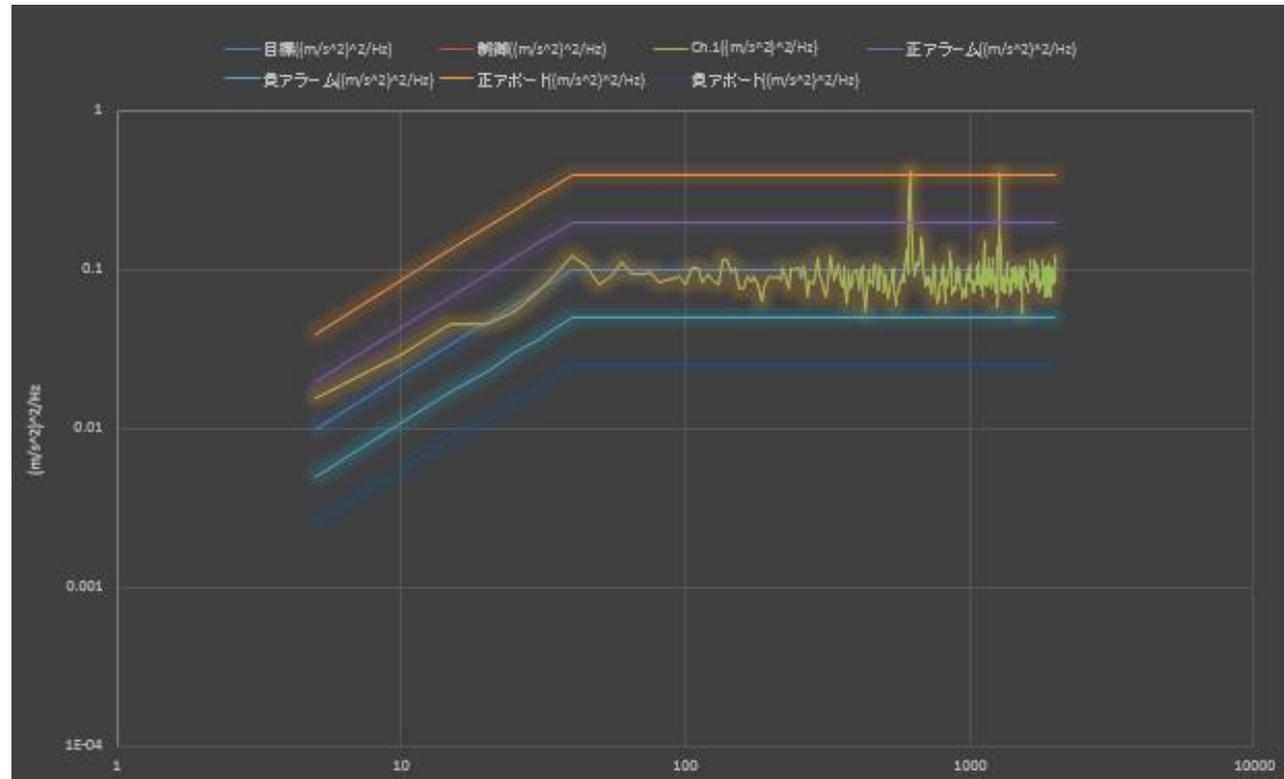

Random oscilation test

Acceleration

PSD

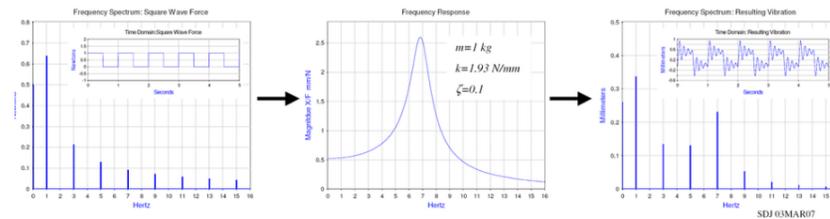

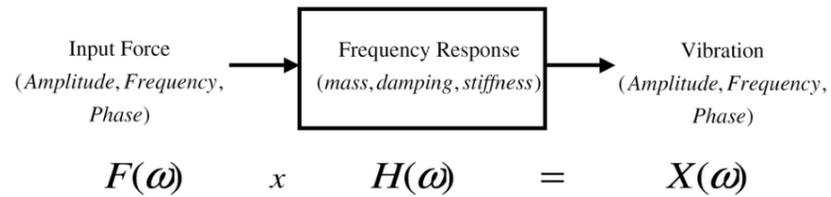

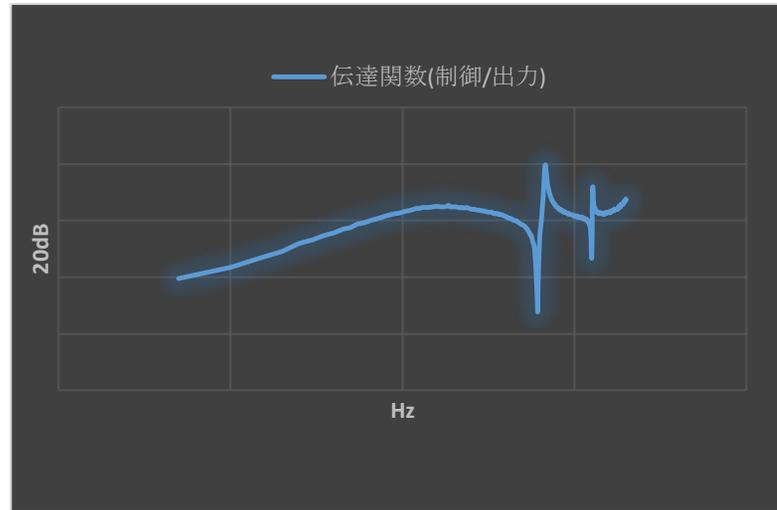

Power spectral densities (PSD) are used to characterize random vibration signals.

Transfer function

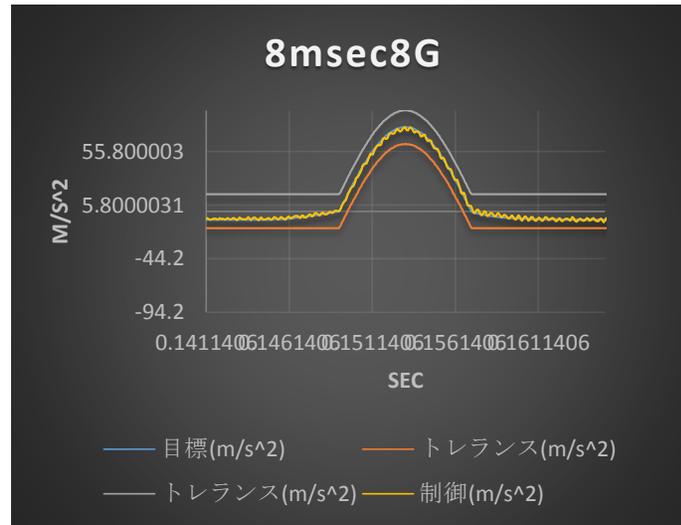

Called the frequency response function.

Force is the input and the output is the vibration.

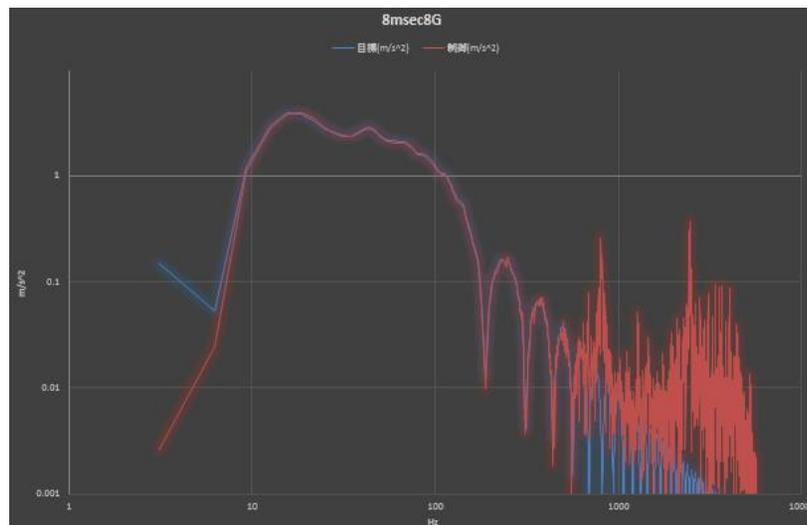

Shock test

Acceleration

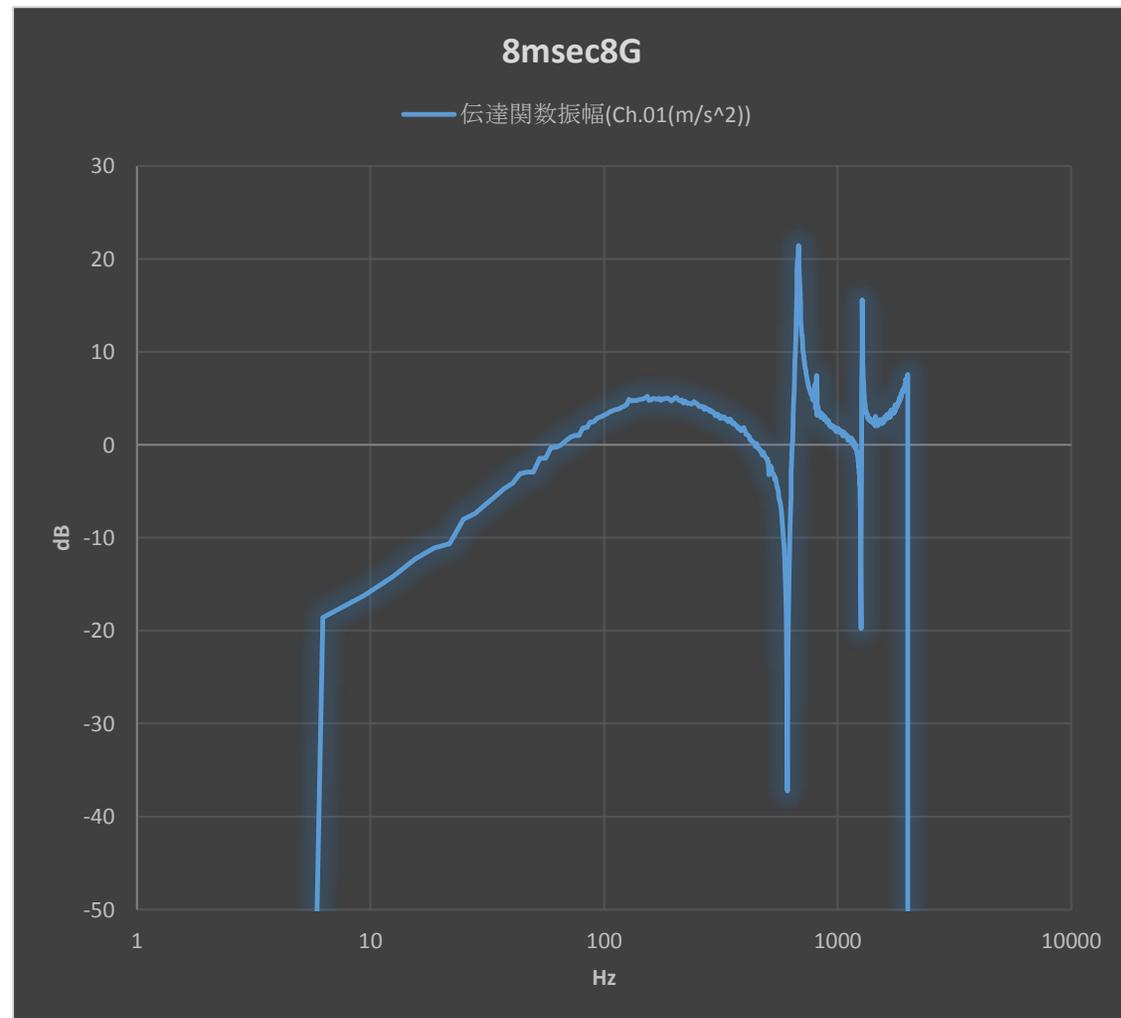

FFT

Is a discrete Fourier transform algorithm which reduces the number of computations needed for N points

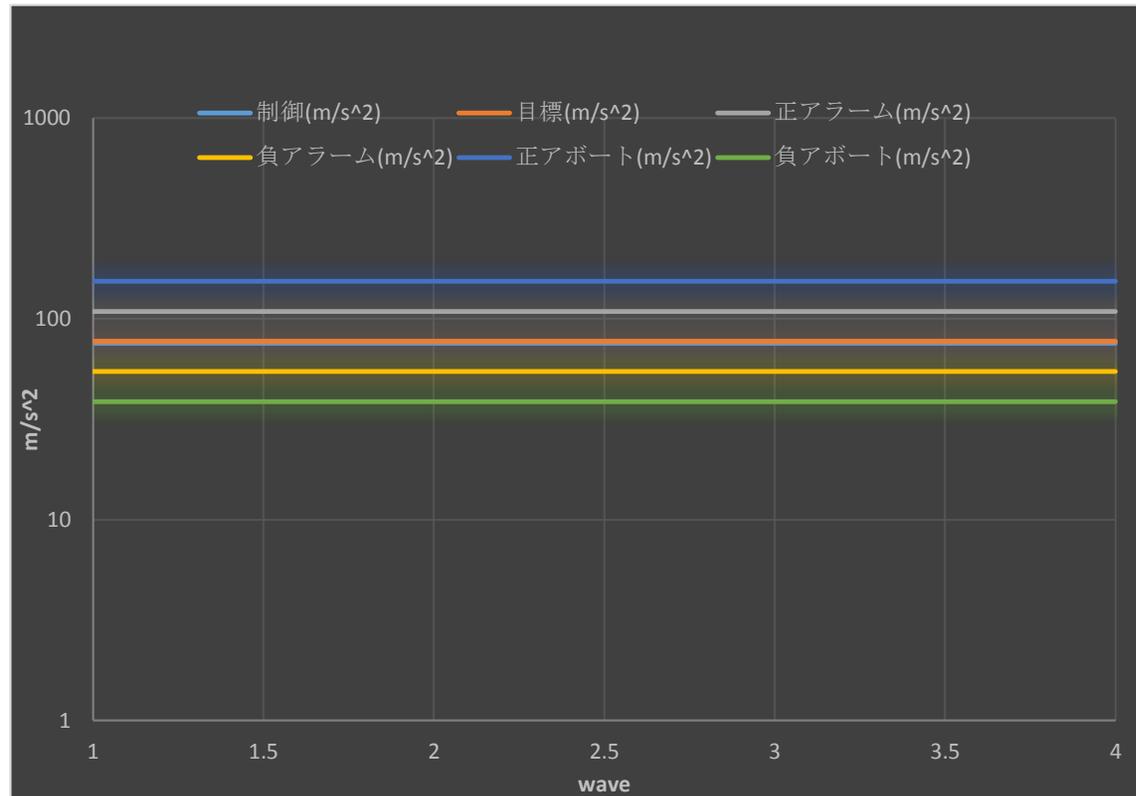

Transfer
function

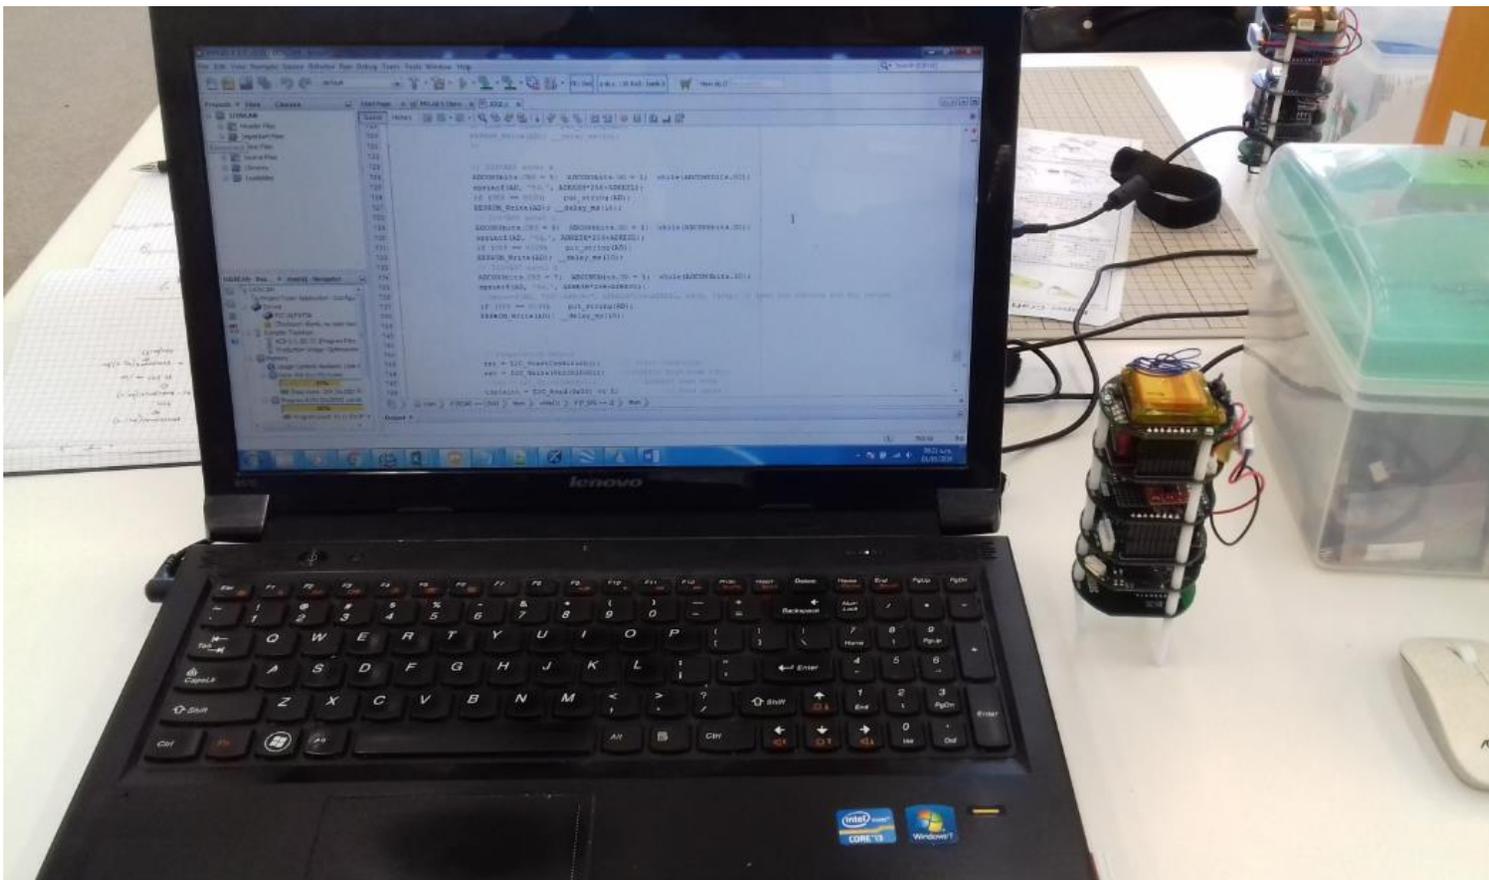

Sine test

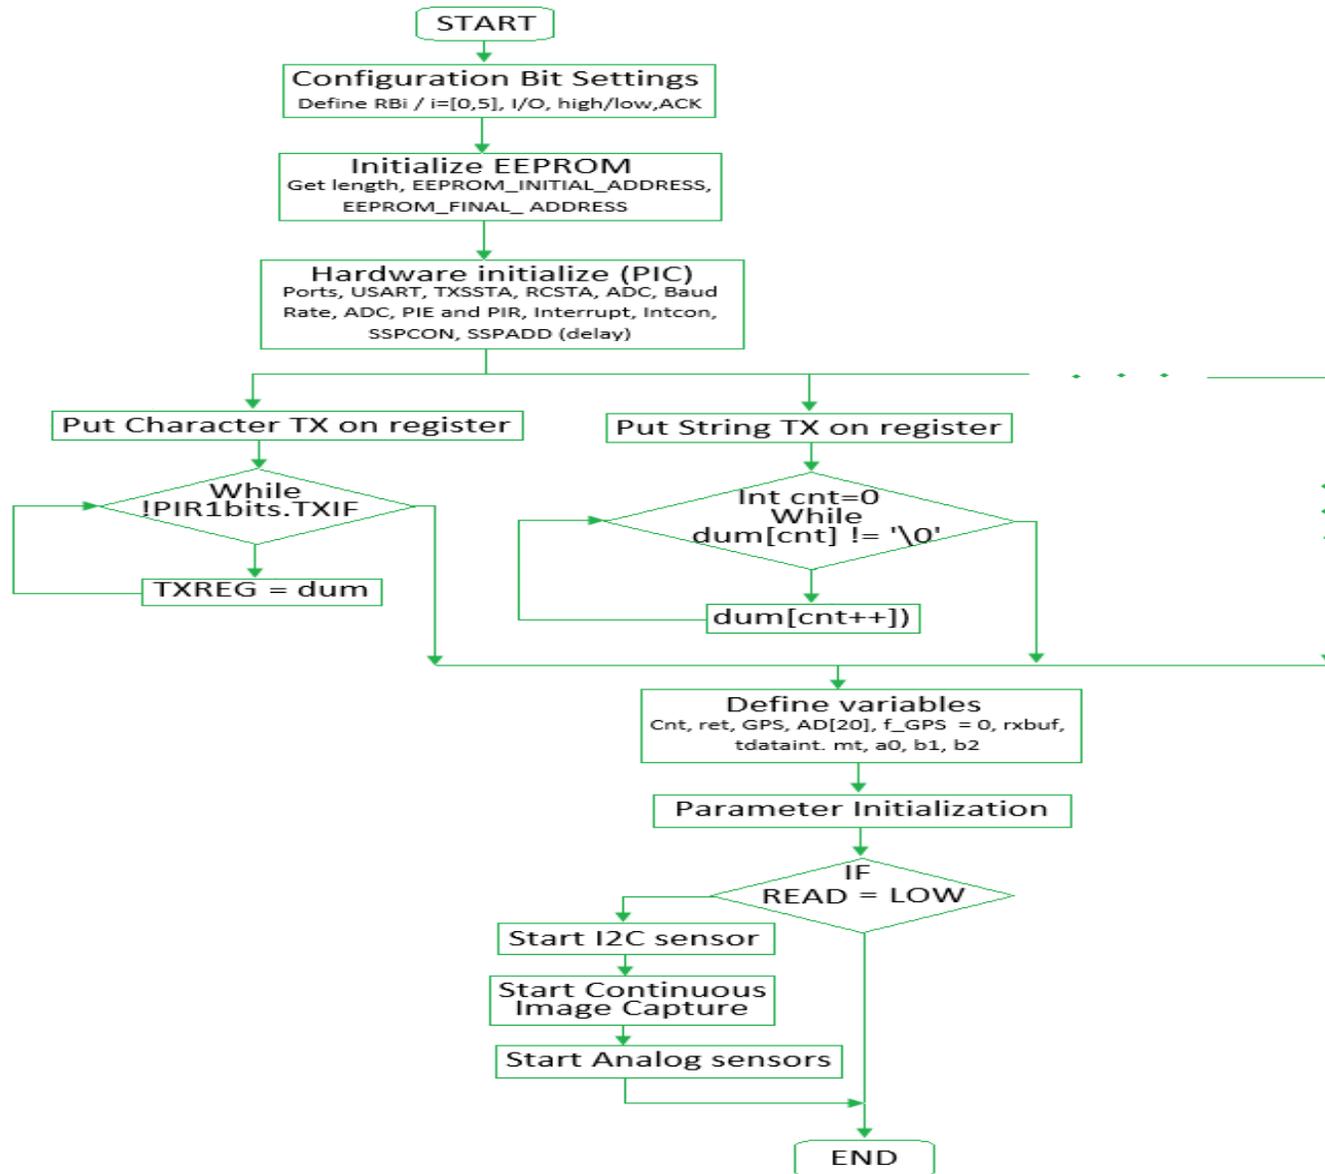

Acceleration

5. Programming i-CanSat

Flow diagram

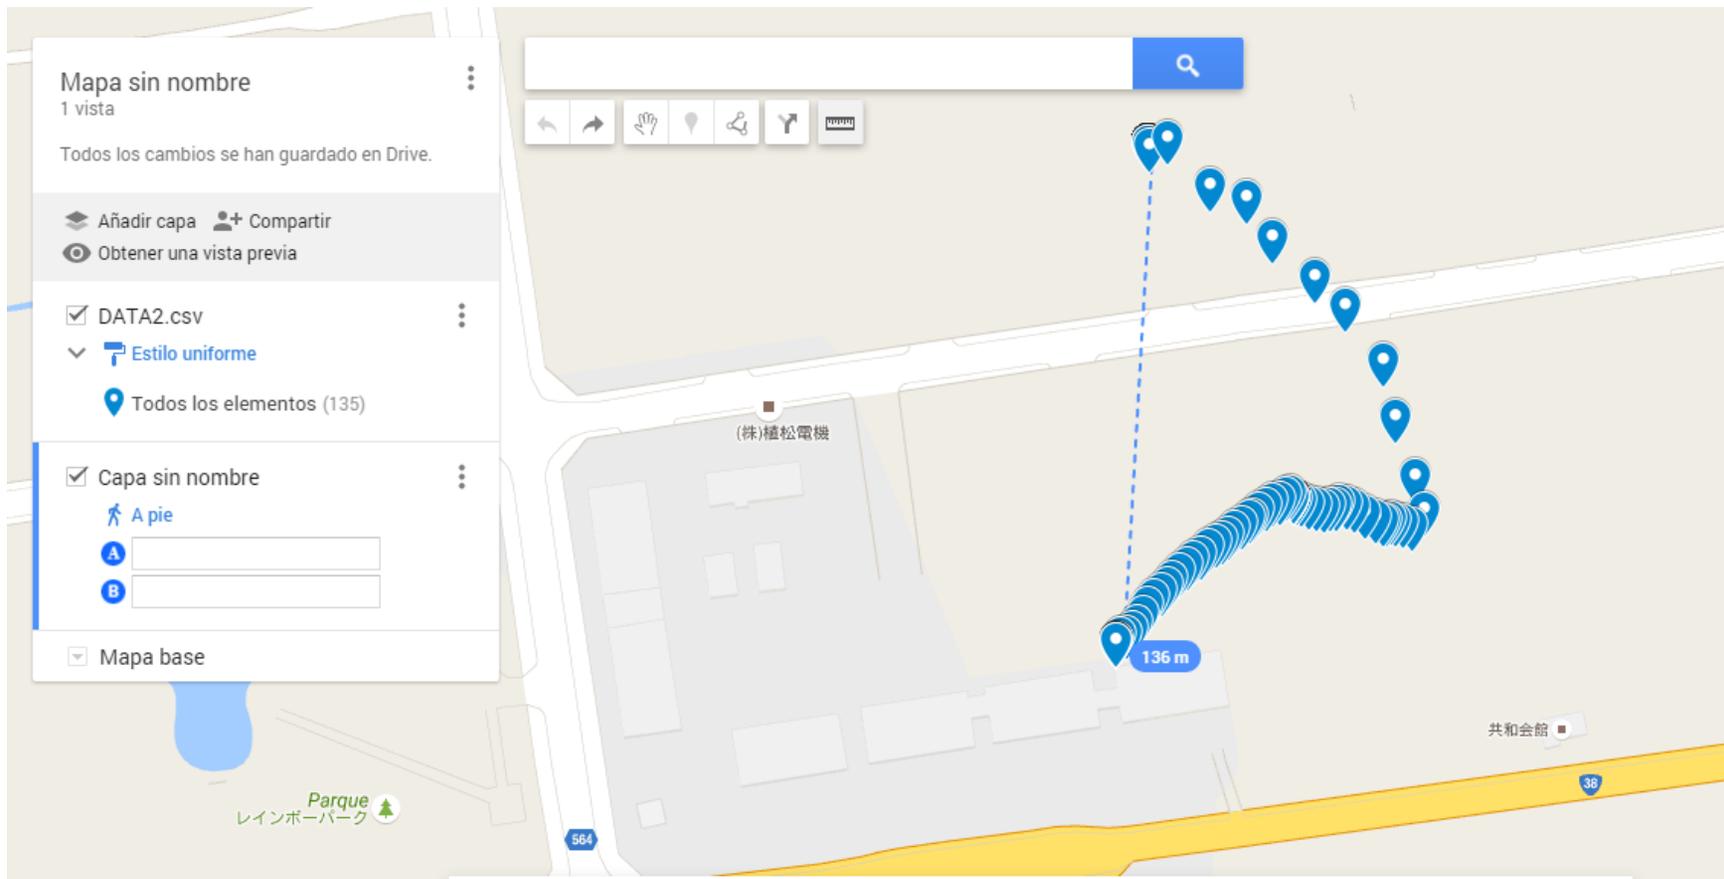

6. Paper rocket assembly and launch

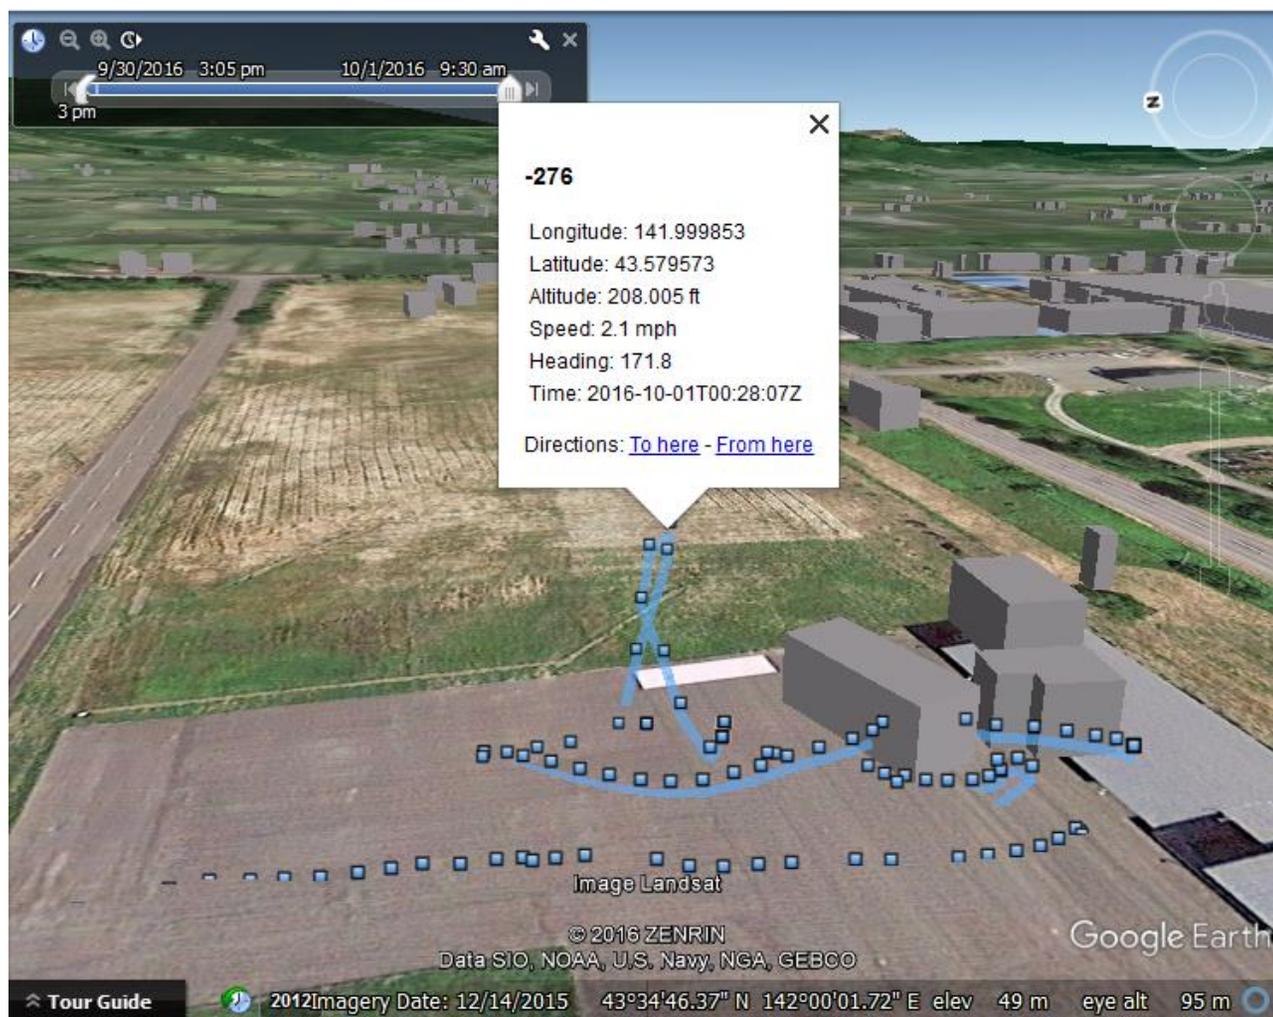

7. Telemetry Results

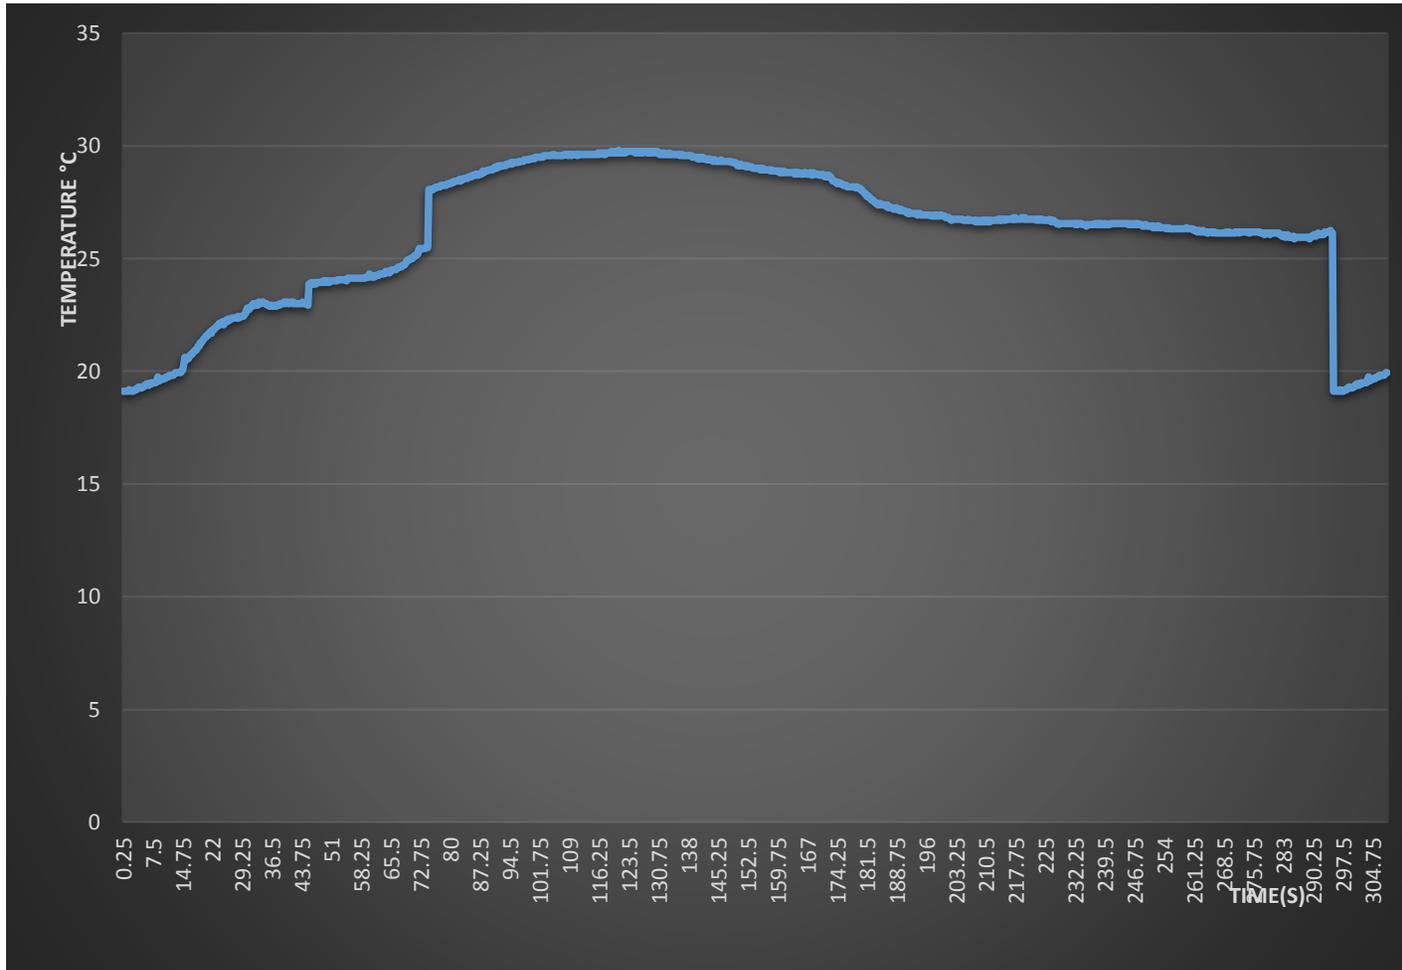

Launching and landing of IcanSat – First launch

Launching and landing of IcanSat – Second Launch

Temperature sensor data

8. Acknowledgments

Special thanks to:

PhD. Totani Tsuyosi

PhD. student Takanashi Tomohiro
